Use Case: XL button

Button Text

Buttons

A button triggers an action or event. Use buttons for important actions like submitting a response, committing a change, or moving to the next step. If you need to navigate to another place, try a link instead. A toggle button is a two-

state behavior that switches a state between on and off. A button’s rest state indicates “off” while the selected state indicates “on.”

Icon only

Links

A link is styled text that leads somewhere else, either within an experience or to a different app or site.

Don't use links for triggering actions, try a transparent button instead.
